provides an outline and modern overview of the classification of the finite simple groups it primarily covers the even case where the main groups arising are lie type matrix groups over a field of characteristic 2 the book thus completes a project begun by daniel gorenstein s 1983 book which outlined the classification of groups of noncharacteristic 2 type

this book focuses on complex analytic dynamics which dates from 1916 and is currently attracting considerable interest the text provides a comprehensive well organized treatment of the foundations of the theory of iteration of rational functions of a complex variable the coverage extends from early memoirs of fatou and julia to important recent results and methods of sullivan and shishikura many details of the proofs have not appeared in print before

a modern approach to number theory through a blending of complementary algebraic and analytic perspectives emphasising harmonic analysis on topological groups the main goal is to cover john tates visionary thesis giving virtually all of the necessary analytic details and topological preliminaries technical prerequisites that are often foreign to the typical more algebraically inclined number theorist while most of the existing treatments of tates thesis are somewhat terse and less than complete the intent here is to be more leisurely more comprehensive and more comprehensible while the choice of objects and methods is naturally guided by specific mathematical goals the approach is by no means narrow in fact the subject matter at hand is germane not only to budding number theorists but also to students of harmonic analysis or the representation theory of lie groups the text addresses students who have taken a year of graduate level course in algebra analysis and topology moreover the work will act as a good reference for working mathematicians interested in any of these fields

## **The Classification of Finite Simple Groups**

2011

this is an introduction to diophantine geometry at the advanced graduate level the book contains a proof of the mordell conjecture which will make it quite attractive to graduate students and professional mathematicians in each part of the book the reader will find numerous exercises

this book is a systematic account of the impressive developments in the theory of symmetric manifolds achieved over the past 50 years it contains detailed and friendly but rigorous proofs of the key results in the theory milestones are the study of the group of holomorphic automorphisms of bounded domains in a complex banach space vigué and upmeier in the late 1970s kaup s theorem on the equivalence of the categories of symmetric banach manifolds and that of hermitian jordan triple systems and the culminating point in the process the riemann mapping theorem for complex banach spaces kaup 1982 this led to the introduction of wide classes of banach spaces known as jb triples and jbw triples whose geometry has been thoroughly studied by several outstanding mathematicians in the late 1980s the book presents a good example of fruitful interaction between different branches of mathematics making it attractive for mathematicians interested in various fields such as algebra differential geometry and of course complex and functional analysis
