Common Legal Framework for Takeover Bids in Europe: Volume 2

1955

the council directive of 21 april 2004 on takeover bids sets forth the general principles applicable to takeover bids and clarifies certain minimum rules with respect to the procedure for a takeover bid the obligation to make a mandatory bid in the event a minimum threshold is crossed and the majority shareholder s squeeze out right as well as the minority shareholders sell out right furthermore the directive defines the authority which is competent to approve offer documents and supervise takeover bids and provides for optional restrictions on the actions of the target company s management and on defence mechanisms this book discusses the takeover directive and its implementing rules in each member state of the european union and the european economic area providing companies and their advisors with useful insight into the legal framework and principles applicable to takeover bids in the region

in high energy gas flows at high velocities and high temperatures physical and chemical processes such as molecular vibrational excitation dissociation ionisation or various reactions take place and deeply influence the structure of the flows the characteristic times of these processes have the same order of magnitude as aerodynamic characteristic times so that these reactive media are generally in thermodynamic and chemical non equilibrium this book presents a general introductory study of these media in the first part their fundamental statistical aspects are described starting from their discrete structure and taking into account the interactions between elementary particles transport phenomena relaxation and kinetics as well as their coupling are analysed and illustrated by many examples the second part deals with the macroscopic re entry bodies finally the experimental aspects of these flows their simulations in shock tubes and shock tunnels are described as well as their application particularly in the aerospatial domain this book is intended for students that have acquired a basic knowledge in thermodynamics statistical physics and fluid mechanics it will also be of interest to engineers in research and industry in particular in the aerospace industry and more generally to all researchers trying to simulate and calculate complex reactive flows

this more of physics less of math insightful and comprehensive book simplifies computational fluid dynamics for readers with little knowledge or experience in heat transfer fluid dynamics or numerical methods the novelty of this book lies in the simplification of the level of mathematics in cfd by presenting physical law instead of the traditional differential equations and discrete independent of continuous math based algebraic formulations another distinguishing feature of this book is that it effectively links theory with computer program code this is done with pictorial as well as detailed explanations of implementation of the numerical methodology it also includes pedagogical aspects such as end of chapter problems and carefully designed examples to augment learning in cfd code development application and analysis this book is a valuable resource for students in the fields of mechanical chemical or aeronautical engineering
